

This is an **excellent question** — this is exactly how professional systems are validated.

Below is your **complete test design for User Management & Authentication** (covering both **positive** and **negative** cases for your LMS).

Save this. This is real QA thinking.

User Management & Authentication — Test Cases

1 User Registration

Positive Tests

1. Register with valid email, password, role → **Success**
 2. Password stored hashed → **Verified**
 3. Student registration creates Student role → **Success**
 4. Instructor registration creates Instructor role → **Success**
 5. Duplicate email prevented → **Blocked**
-

Negative Tests

1. Register with existing email → **Fail**
 2. Register with invalid email format → **Fail**
 3. Register with weak password → **Fail**
 4. Register without role → **Fail**
 5. Register while logged in → **Blocked**
-

2 Login

Positive Tests

1. Login with correct credentials → **Success**

2. Student redirected to Student Dashboard → **Success**
 3. Instructor redirected to Instructor Dashboard → **Success**
 4. Admin redirected to Django Admin → **Success**
-

Negative Tests

1. Wrong password → **Fail**
 2. Wrong email → **Fail**
 3. Inactive account → **Blocked**
 4. Unverified email (if implemented) → **Blocked**
-

3 Logout

Positive Tests

1. Logout clears session → **Success**
 2. Cannot access dashboard after logout → **Blocked**
-

Negative Tests

1. Logout without being logged in → **Handled gracefully**
 2. Double logout → **Handled gracefully**
-

4 Role-Based Access

Positive Tests

Scenario	Expected
Student visits Student Dashboard	Allowed
Instructor visits Instructor Dashboard	Allowed
Admin logs in	Redirect to Admin Panel

✖ Negative Tests

Scenario	Expected
Student visits Instructor Dashboard	Blocked
Instructor visits Student Dashboard	Blocked
Unauthenticated user visits any dashboard	Redirect to login

5 Security Tests

✖ Negative Tests

1. Access dashboard via URL without login → **Blocked**
 2. Attempt role tampering via form → **Blocked**
 3. Attempt to change role after registration → **Blocked**
 4. Access admin without superuser privileges → **Blocked**
-

System Integrity Tests

✖ Negative Tests

1. Attempt manual role change via request → **Rejected**
 2. Try creating admin via registration → **Blocked**
 3. Try deleting own user while logged in → **Blocked**
 4. Session hijacking simulation → **Invalidated**
-

Interview-Level Summary

“The authentication system is validated through positive and negative tests covering registration, login, role enforcement, redirection, and security restrictions.”

Why This Matters

This shows you didn't just "build features".
You designed **correctness, security, and reliability**.

If you want, next I can help you design:

- Test cases for **Course & Enrollment**
- Or prepare a **final project testing document**
